

# Ebola Virus Disease: A Comprehensive Guide for Clinicians and Public Health Professionals

By Dr. Dennis Clark

Ebola virus disease (EVD) is a severe, often fatal illness that is caused by infection with the Ebola virus. The virus is transmitted through direct

contact with the blood or other bodily fluids of an infected person. EVD can also be transmitted through contact with objects that have been contaminated with the virus, such as clothing, bedding, or medical equipment.

EVD is a major public health concern, particularly in Africa, where the virus is endemic. The largest outbreak of EVD on record occurred in West Africa from 2014 to 2016, and resulted in more than 11,000 deaths.

There is no specific cure for EVD, but treatment can help to improve the chances of survival. Treatment includes supportive care, such as fluids, electrolytes, and antibiotics, as well as antiviral medications.

Prevention of EVD is critical. The most important preventive measure is to avoid contact with the blood or other bodily fluids of infected people. Other preventive measures include:

- Washing hands frequently with soap and water

- Avoiding contact with objects that may have been contaminated with the virus
- Getting vaccinated against EVD
